

ABSTRACT

A kit of parts assembles into a tool support using an elongate beam such as a wooden joist provided by the purchaser of the kit. The kit includes a pair of uprights suitable for clamping onto spaced apart positions on the beam. A tool supporting member also mounts onto the beam, intermediate the uprights and includes a supporting surface for supporting a tool, for example a saw, thereon. The kit includes minimal components to be transported from site to site by the user. The kit also occupies minimal space when separated from the beam such that retailers are only required to stock minimal parts on store shelves at reduced cost as the user can supply their own beam.
